SPEC Portfolio concept by Luka Skhiladze and Giorgi Kheladze. Kindtill is a fictional brand.

Kindtill concept, *checked before launch.*

17 October 2026 · Prepared by Luka Skhiladze and Giorgi Kheladze

STORY PAGE	REGISTRATION FORM	READ-ONLY WEBFLOW DESIGNER
bfg-spec.webflow.io	**bfg-spec.webflow.io/register/**	**Open the build**

"Live" means the published concept above. "Local" means the same form code running on a test machine against a fresh database. Copy marked "Draft copy" and the example causes are placeholders, not claims.

Launch checklist, line by line

The checks a site should pass before launch: devices and browsers, loading speed, keyboard access, reduced-motion options, links and form pathways, failed submissions and duplicate prevention, basic search info and agreed analytics.

Checklist item	What was checked	How	Result
Devices and browsers	Story page and form at phone (375 and 390 px), tablet (768 px) and desktop (1440 px) widths	Chromium (desktop browser pane, live site); Chromium 141 via Playwright (local)	No sideways scrolling at any width; every section re-lays out for phones (single column, stacked tabs, two-column photo grid). Safari, Firefox and real phones are in the list below.
Loading speed	Mobile lab test of the concept and of four well-known storytelling sites, same profile, same morning, three runs each	PageSpeed Insights, Lighthouse 13.5, emulated Moto G Power on slow 4G	Story page: performance **81** (median of three), largest paint 3.7 s, layout shift 0.003, blocking time 0 ms. Form: **84**, blocking time 0 ms. The four reference sites: 35 to 62 (table below).
Keyboard access	Story page by keyboard alone; the form completed by keyboard alone	Real key presses (live); Playwright (local, test 23 below)	Skip link first, then every link, tab and question in reading order, each with a visible focus ring. Audience tabs switch with the arrow keys. The Business path completed and confirmed without a mouse.
Reduced-motion options	The device's "reduce motion" setting on and off	Real setting on (live); setting overridden in a test copy of the live page (live); test 24 (local)	**On:** no scroll animations run and nothing is hidden. The ripple shows as one finished picture: five purchases, five rings, every label. **Off:** desktop gets the pinned, scroll-driven sequence; phones and tablets get unpinned step-by-step reveals.
Links	Every link on the story page, the three path links, the CMS item pages, the collection notice	Each URL requested on the live site	All return 200. The three path links open the form with that path already chosen.
Form pathways	One registration per path on the deployed app; each path's questions on their own	Live submissions with @example.com addresses (deleted afterwards); tests 1–4 (local)	Supporter, Business and Charity each saved with only their own questions. Answers from a path the visitor switched away from are neither sent nor stored.
Failed submissions	Simulated outage on the live app; offline, timeout and server error locally	Reviewer tools on the live form; tests 8–10 (local)	Every answer stays on screen and on the device. The visitor gets *Try again*, *Copy my answers* and *Email them instead*. *Try again* saves exactly once.

Checklist item	What was checked	How	Result
Duplicate prevention	Same email typed with different capitals and spaces; double-tap; two identical requests at the same moment; retry after a lost response	Live duplicate attempt; tests 5–7 and 11–12 (local, checked in the database)	One registration per email per path, enforced by the database. A repeat gets a message that reveals nothing stored, and the address on file is sent a manage link.
Basic search info	Page title and meta description on every page; social preview text on the home page	Page source on the live site	Set, and each one says it is a concept. The form pages also send `noindex`. The story page can't be kept out of search on the free plan (Webflow needs a paid site plan for that), so its title and description carry the concept label instead.
Agreed analytics	Not part of the concept	—	The free Webflow plan allows no scripts. For the real build: privacy-friendly events for *path chosen*, *form started* and *registration sent*, agreed with the client first.
Accessibility (supports the items above)	Automated WCAG 2.0–2.2 A/AA rules	axe-core 4.10 on the live story page at desktop and phone width, with every tab shown and every FAQ open; test 22 on five form states (local)	**0 issues** after one fix (a small grey note on a light background was darkened to pass contrast). Lighthouse accessibility: **100** on the story page and on the form (the form scored 96 until the reviewer-tools button was moved off the free-plan Webflow badge).

Loading speed (mobile)

PageSpeed Insights, mobile, Lighthouse 13.5.0, emulated Moto G Power on slow 4G. Three runs per page on 17 October 2026, between 06:32 and 07:07 (GMT+4). Lab scores move from run to run, so each row is the median run by performance score, with the range of the three scores beside it. Each page name links to its median report.

Page	Performance (range)	Accessibility	Best practices	SEO	First paint	Largest paint	Blocking time	Layout shift
Concept story page	**81** (79–83)	**100**	**100**	**100**	3.5 s	3.7 s	0 ms	0.003
Concept form (/register/)	**84** (84–84)	**100**	**100**	63*	2.3 s	4.0 s	0 ms	0
xrecruiter.io	35 (30–47)	76	54	100	3.8 s	24.1 s	1,130 ms	0.044
thankyou.co	58 (49–68)	77	73	92	2.5 s	11.7 s	350 ms	0.063
kivawellness.com.au	43 (37–68)	96	73	100	3.2 s	9.8 s	890 ms	0
pledge1percent.org/how-it-works	62 (55–64)	97	96	92	2.7 s	4.1 s	60 ms	0.448

* The form is deliberately kept out of search (`noindex`), which Lighthouse counts against SEO.

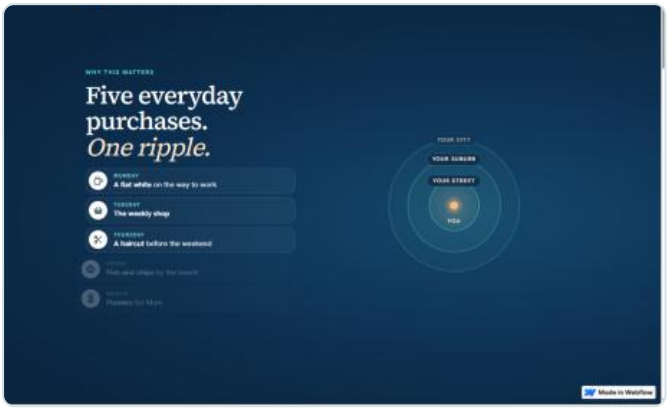

What still holds the concept back:

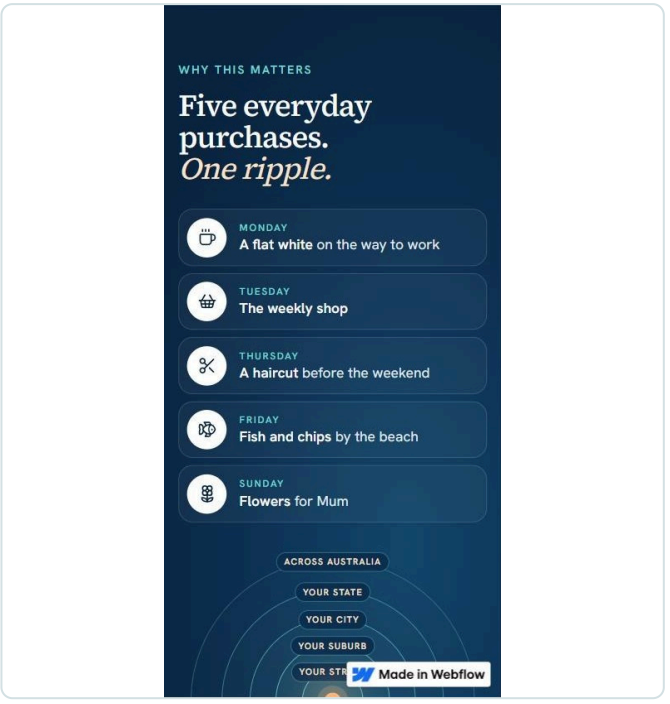

- **Story page:** about 2.7 s of render-blocking time from the Google Fonts loader and the stylesheet that the free Webflow plan includes. In the real build the fonts are self-hosted and preloaded, which removes most of it.
- **Form:** its stylesheet used to come from a separate asset host and block the first paint. It is now part of the page itself, which brought first paint from about 2.8 s to 2.3 s. What remains is the headline being painted a second time when its web font arrives. In the real build, a fallback font sized to match removes most of that.

The ripple, three ways

Version	When	What happens	How it was checked
Desktop	Screens 992 px and wider, motion allowed	The section pins for two and a half screens of scrolling. Each purchase lights up in turn and adds a ring: your street, your suburb, your city, your state, across Australia. The closing line comes last.	Live page: 3 scroll triggers, the ripple pinned; scroll position checked at 0%, 25%, 50%, 75% and 100% (two purchases and rings at 25%, three at 50%, all five at 100%)
Phone and tablet	Under 992 px, motion allowed	No pinning. Each purchase steps in as it reaches the reader's thumb (85% down the screen). The rings spread from the centre when the picture arrives, then the closing line.	Live page at 390 and 768 px: 8 scroll triggers, none pinned, purchases revealed one at a time
Reduced motion	"Reduce motion" switched on, any size	Nothing moves and nothing is hidden: the finished picture, readable top to bottom	Live page with the setting on: no scroll triggers created, every element fully visible

Only transforms and opacity are animated. The ring picture has a text description for screen readers, and the purchases are a real list, so the story reads the same without the visuals. No figures appear in the sequence.

Editable by the site owner

Benefits and FAQs are CMS items in two collections (Benefits, FAQs), 18 in all, shown per audience in Webflow's native tabs. Changing wording, adding a question or reordering is done in the Webflow Editor without touching the design. Brand colours are site variables, so a colour change updates every section at once.

Only real devices can confirm

- iPhone (Safari): the pinned section and the address bar resizing while scrolling; the on-screen keyboard over form fields; safe areas.
- A mid-range Android phone (Chrome): smoothness of the reveals on real hardware.
- VoiceOver (iOS) and TalkBack (Android): reading order through the ripple, the tabs and the FAQ disclosures.
- "Reduce motion" set on the phone itself (iOS: Accessibility → Motion; Android: Remove animations).
- Turnstile on real phones (the concept uses Cloudflare's test keys).
- Real email delivery and spam placement, once a sending domain is connected.

- Losing signal mid-submit on mobile data.
- Safari and Firefox on desktop.

The form's break tests

Run 2026-10-17 12:34 UTC. 27 of 27 passed. They run against the built app and a fresh database, and every check reads the database itself, not only the page.

#	What was tried, and what should happen	Result
1–3	Each path end to end on a phone: only that path's questions are shown and stored, optional ones left empty, the confirmation names the path, and the confirmation email and CRM hand-off are queued and processed. (3 variants)	Pass
4	Fill business questions, then switch to Supporter and send: the business answers are neither sent nor stored.	Pass
5	Double-clicking the submit button saves one registration and queues one confirmation email.	Pass
6	Two requests with the same idempotency key sent at the same moment (bypassing the browser): both get the same reference, and the database keeps one row.	Pass
7	A retry after a lost response (same key sent again later): the same reference comes back and no second row is created.	Pass
8	Reviewer tools → 'Fail the next submission': the failure panel offers Try again, Copy my answers and Email them instead; every answer stays on screen; Try again saves exactly once.	Pass
9	Sending while offline: an offline message, nothing lost, nothing saved; back online, Try again saves exactly once.	Pass
10	Answers typed but not yet sent survive a reload (kept on the device), the path is remembered, and sending afterwards works once.	Pass
11	The same email on the same path again (new attempt): a friendly 'already registered' message that reveals nothing stored; still one row; a 'manage your registration' email is queued to the address on file.	Pass
12	' Test@Example.COM ' and 'test@example.com' count as the same person on the same path; the same email on a different path is allowed.	Pass
13	Updates unticked → stored as 'no' and the CRM payload is not subscribed; ticked → stored with its exact wording and time; missing contact consent → rejected with a field error and nothing stored.	Pass
14	Both consent boxes start unticked; sending without the contact box shows a clear, linked error and sends nothing.	Pass
15	Honeypot filled → a normal-looking success and nothing stored. Sent faster than a person could fill the form → asked to send again, nothing stored.	Pass
16	The private manage link shows what was stored and both permissions with their wording; 'Stop news and updates' updates the row and logs it; delete removes the row, its emails and its log; the old link then says it was deleted.	Pass
17–21	The server checks everything itself, bypassing the browser: a missing required answer, a bad email, an ABN that fails the checksum, an option that isn't on the list, an unknown path → 422 with that field's error, nothing stored. (5 variants)	Pass
22	axe-core with the WCAG 2.0–2.2 A/AA rules on the empty form, the form with errors, the failure panel, the confirmation and the manage page: zero serious or critical issues.	Pass
23	Keyboard only (Tab, Shift+Tab, arrow keys, Space, Enter and typing): complete the Business path and land on the confirmation, with focus moved to it.	Pass
24	With the device set to reduce motion, transitions and animations are switched off (buttons, inputs, the sending spinner).	Pass
25–26	Screenshots of every state (each path, errors, failure, duplicate, confirmation, manage page) at 390×844 and 1440×900, for visual review. (2 variants)	Pass
27	Transfer weight of a first visit to /register/, by type (HTML, CSS, JavaScript, fonts).	Pass

First visit to the form, uncompressed: HTML 36,075 bytes, CSS 0 bytes (the stylesheet now ships inside the HTML), JavaScript 12,830 bytes, Fonts 85,640 bytes, Total 134,545 bytes.
